

Founded by László Kishonti in 2015, Almotive is the leading global provider of AI powered self-driving technology. Using cameras as primary sensors our solutions mimic the visual capabilities of human drivers. This approach results in technology that can readily scale, and helps make autonomous driving a reality around the world.

Our passionate team with over 150 members is at work worldwide. We have designed aiDrive, our autonomous driving software suite, to accommodate different driving cultures and climates, because we approach the driving experience from a global perspective.

Alongside our testing locations we use, aiSim, our photo-realistic simulator, to recreate diverse real-life scenarios to develop our systems. To handle the complex process behind self-driving technology we have created aiWare, a unique neural network accelerator for computer vision. We believe this is how to make our vision of a safe and accessible autonomous future a reality.

We have already a couple of ongoing development projects for well-known automotive firms eg. PSA, Volvo etc.

Almotive is a privately held, independent company, headquartered in Budapest with offices in Mountain View, California and Helsinki, Finland.
